# 4G Fast-start & Backup

Data connectivity

FACT: Time is money

Ensuring that you have fast, reliable access to the internet with seamless back-up systems is worth every penny.

Consider all the critical processes used every day across your business.

How much it would cost to have to wait for a new connection during a move or if your connection goes down and you must wait for an engineer or equipment before it can be fixed.

You would opt for a hire car whilst yours in the garage, so why not do the same with your digital connectivity?

Why add 4G Fast-start and Backup to your data connection?

- **No delays getting started**
  You are in control;
  no waiting for others to get started

- **Peace of mind**
  Never lose business because of downtime

- **Flexibility**
  Simply plug-and-play;
 work anywhere with a 4G signal

How does Fast-start work?

Instant data service

4G Fast-start is a connection to the Gamma network that provides an instant data service until the primary Ethernet circuit goes live. A 4G router is supplied within a few days of an order being placed, and once the SIM is activated on the Gamma network an Internet data connection is available. Fast-start is ideal for any business that is on the move or upgrading their connectivity services.

When the primary Ethernet circuit is activated, the Fast-start service is automatically transitioned into Backup requiring no further configuration. There are no hidden usage charges so you can benefit from peace of mind and the reassurance that you will always be connected.

How does Backup work?

Automatic - keeping you connected

If the 4G router detects the primary Ethernet service has lost connectivity, the router automatically switches over to the 4G Backup service to support Internet connectivity over mobile broadband. Mobile internet is facilitated by the inbuilt SIM and the Backup service will connect to the 4G network in a few seconds so any downtime will be minimal.

The router will automatically revert to the primary Ethernet connection when service is restored. 4G Backup does not activate if the Ethernet connection is degraded or to "boost" bandwidth.

Things to consider

- Fast-start and Backup are available together or independently, and you can add or remove Backup at any point in your contract term.

- 4G Fast-start and Backup are services that work with Gamma's Ethernet managed Internet access services.

- They are delivered using a single SIM and they do not replicate the throughput of a large bandwidth data access product.

- 4G requires good indoor 4G coverage to work effectively. This is not available everywhere, so it is advisable to do thorough checks of both network coverage and installation requirements before ordering.

- There is an unlimited data allowance for both 4G Fast-start and Backup so you will not incur any unexpected costs.
